_____

Hi,

Laptop 5 to 10 min off then you start and press f8 button regular then open new windows and select safe mode and follow instruction. When open windows safe mode then not graphic come because safe mode not support graphic so don`t wary. If your windows open safe mode then it means your windows or hardware ok and running. Then after you restart laptop and try it normal mode open windows if open then ok or if not ok then return open safe mode and windows back date choose and follow reset windows.

Thanks.
