Laptop M5030 beeping and shutdown
Posted by admin - 30 Jun 2012 18:19

_____

Hi, My Dell laptop M5030 was running ok then this morning my husband was on the web and the screen went blank and started beeping. The sequence of beeps went 3-3-1 I looked it up and said it was NVrad insufficient power. So I tried unplugging and removing battery. Then hitting FN + End simultaneously and plugging back in without battery and restarting. It does restart and comes on for a moment but then keeps shutting down unexpectedly. I'm not sure what the issue is now. A friend said that I would have to replace the motherboards battery, by removing back panel. But I'm wondering if that's even actually the issue or if it's a problem with the processor. Can someone help?
